

## Aircraft Landing Gear Drop Test Simulation And Design Evolution

Right here, we have countless book **aircraft landing gear drop test simulation and design evolution** and collections to check out. We additionally allow variant types and moreover type of the books to browse. The up to standard book, fiction, history, novel, scientific research, as without difficulty as various further sorts of books are readily genial here.

As this aircraft landing gear drop test simulation and design evolution, it ends in the works visceral one of the favored ebook aircraft landing gear drop test simulation and design evolution collections that we have. This is why you remain in the best website to look the incredible books to have.

Aircraft Landing Gear Drop Test

These drop tests, known as the Approach and Landing Test program, used a modified Boeing 747, known as the Shuttle Carrier Aircraft or SCA, to carry Enterprise to an altitude of 15,000 to 30,000 feet (4,600 to 9,100 m). After a series of captive-flight tests in which the orbiter was not released, five free-flight tests were performed in August through October 1977.

The Landing gear drop test is a dynamic test of simulating aircraft landing impact. The situation of landing gear is obtained by measuring various parameters such as displacement, load, acceleration, force and stain. The more parameters are measured, the more clearly it simulates the situation at landing.

Experimental Research on Aircraft Landing Gear Drop Test ...

Abstract: The structure of a shock absorber based on magnetorheological (MR) damper with a metering pin is proposed, and structure of the magnetic circuit of MR damper is optimized. By drop tests, the damping characteristics of the shock absorber and damping effect are tested. The experimental results show that the shock absorber has the characteristic of a wide damping force adjustment range and lower energy dissipation.

Sec. 23.725 — Limit drop tests. h (inches)=3.6 ( W/S ) 1/2. However, the free drop height may not be less than 9.2 inches and need not be more than 18.7 inches. (b) If the effect of wing lift is provided for in free drop tests, the landing gear must be dropped with an effective weight equal to.

So, the full definition of a drop test is: "From a given height of drop the peak airframe G load shall not exceed the test limit and there shall be no permanent damage to the landing gear or airframe." I believe the FAA standard drop height is 48" and I think the peak G limit is about 4 G; but, I'm not entirely sure about these numbers.

In order to do this, before an aircraft is certified for flight, the gear must undergo a test known as the drop test. Here, manufacturers drop the gear to simulate forces experienced in not only normal and testing conditions, but also those well beyond what the aircraft might ever expect to encounter. To absorb the shock of the landing impact, the landing gear has an oleo strut, which acts as a type of suspension.
