Modern societies are to a great extent dependent on computers and information systems, but there is a negative side to the use of information and communication technology – the rise of a new kind of criminality not traditionally addressed by the law. Technological developments and the changing nature of cybercrime itself force legislators to deal with new objects and redefine concepts. Taking into account legislative and case law developments, this book provides a thorough analysis of the legal regulation of attacks against information systems in European, international, and comparative law contexts. It covers legal issues not only pertaining to attacks arising in criminal law but also such crucial problems as the conflict of cybercrime investigation and prosecution with fundamental rights to privacy and freedom of expression. The authors' in-depth response to doctrinal and practical issues related to the application of cybercrime regulation include such elements, issues, and aspects as the following: – legal harmonization of cybercrime law; – jurisdictional issues in the investigation and prosecution of cybercrime; – prevention of cyber attacks; – personal data and privacy implications; – hacking of cell phones; – enforcement and forensics in cybercrime law; – states and legal persons as perpetrators of cybercrime; – European Programme for Critical Infrastructure Protection; – Cybercrime Convention of 2001; – Directive 2013/40/EU; – identity theft; – the Snowden revelations and their lessons; – principles, problems, and shortcomings of digital evidence; – legal status of the IP address; – the security and data breach notification as a compliance and transparency tool; – profile and motivation of perpetrators of cyber attacks; – cybercrime as a parallel economy; and – use of cryptocurrency as a means for blackmail operations. Technical definitions, case law, and analysis of both substantive law and procedural law contribute to a comprehensive understanding of cybercrime regulation and its current evolution in practice. Addressing a topic of growing importance in unprecedented detail, this book will be welcomed by professionals and authorities dealing with cybercrime,

This Major Reference Work synthesizes the global knowledge on cybercrime from the leading international criminologists and scholars across the social sciences. The constant evolution of technology and our relationship to devices and their misuse creates a complex challenge requiring interdisciplinary knowledge and exploration. This work addresses this need by bringing disparate areas of social science research on cybercrime together. It covers the foundations, history and theoretical aspects of cybercrime, followed by four key sections on the main types of cybercrime: cyber-trespass, cyber-deception/theft, cyber-porn and obscenity, and cyber-violence, including policy responses to cybercrime. This work will not only demonstrate the current knowledge of cybercrime but also its limitations and directions for future study.

The Istanbul Convention is the most far-reaching international treaty to tackle violence against women and domestic violence. Its comprehensive set of provisions spans far-ranging preventive and protective measures as well as a number of obligations to ensure an adequate criminal justice response to such serious violations of human rights. The Budapest Convention on Cybercrime is the most relevant international agreement on cybercrime and electronic evidence. It provides for the criminalisation of offences against and by means of computers, procedural law tools to secure electronic evidence, and for international co-operation among Parties.

As technology develops and internet-enabled devices become ever more prevalent new opportunities exist for that technology to be exploited by criminals. One result of this is that cybercrime is increasingly recognised as a distinct branch of criminal law. This book is designed for students studying cybercrime for the first time, enabling them to get to grips with an area of rapid change. The book offers a thematic and critical overview of cybercrime, introducing the key principles and clearly showing the connections between topics as well as highlighting areas subject to debate. Written with an emphasis on the law in the UK but considering in detail the Council of Europe's important Convention on Cybercrime, this text also covers the jurisdictional aspects of cybercrime in international law. Themes discussed include crimes against computers, property, offensive content, and offences against the person, and recent controversial areas such as cyberterrorism and cyber-harassment are explored. Clear, concise and critical, this text offers a valuable overview of this fast-paced and growing area of law.

In a world of increasing dependence on information technology, the prevention of cyberattacks on a nation's important computer and communications systems and networks is a problem that looms large. Given the demonstrated limitations of passive cybersecurity defense measures, it is natural to consider the possibility that deterrence might play a useful role in preventing cyberattacks against the United States and its vital interests. At the request of the Office of the Director of National Intelligence, the National Research Council undertook a two-phase project aimed to foster a broad, multidisciplinary examination of strategies for deterring cyberattacks on the United States and of the possible utility of these strategies for the U.S. government. The first phase produced a letter

report providing basic information needed to understand the nature of the problem and to articulate important questions that can drive research regarding ways of more effectively preventing, discouraging, and inhibiting hostile activity against important U.S. information systems and networks. The second phase of the project entailed selecting appropriate experts to write papers on questions raised in the letter report. A number of experts, identified by the committee, were commissioned to write these papers under contract with the National Academy of Sciences. Commissioned papers were discussed at a public workshop held June 10-11, 2010, in Washington, D.C., and authors revised their papers after the workshop. Although the authors were selected and the papers reviewed and discussed by the committee, the individually authored papers do not reflect consensus views of the committee, and the reader should view these papers as offering points of departure that can stimulate further work on the topics discussed. The papers presented in this volume are published essentially as received from the authors, with some proofreading corrections made as limited time allowed.
