Cardiac catheterisation is an invasive diagnostic procedure that provides important information about the structure and function of the heart. It usually involves taking X-rays of the heart's arteries (coronary arteries) using a technique called coronary angiography or arteriography. The resulting images are known as coronary angiograms or arteriograms.

A cardiac catheterisation, or coronary angiogram, is a special test to find out if you have any problems with the coronary arteries (blood vessels that supply the heart muscle with oxygen), and to find out how well the pumping chambers and valves in your heart are working. A cardiac catheterisation will give your doctor information about your heart that they cannot always get from other tests.

During cardiac catheterization, a long thin tube called a catheter is inserted in an artery or vein in your groin, neck or arm and threaded through your blood vessels to your heart. Using this catheter, doctors can then do diagnostic tests as part of a cardiac catheterization. Some heart disease treatments, such as coronary angioplasty and coronary stenting, also are done using cardiac catheterization.
